## ABSTRACT OF THE DISCLOSURE

The method and apparatus processing photographic print represent a plurality of images arranged in a two-dimensional array on a display screen wherein images arranged at least in a one-dimensional direction in succession among the plurality of images are images processed states of which are gradually changed in at least one attribute of image proceeding and perform image verification based on the thus represented plurality of images. The method and apparatus are capable of enhancing efficiency and quality of verification by representing a plurality of images corresponding to changes of processing conditions at a time and comparing a plurality of the thus represented images with each other by an operator.
